Content Checked For Plagiarism

3.4 The and elements

The and elements serve a special function to these elements/parts are usual purpose embedding tools for embedding external content, like PDFs.

But you haven't used these elements so much. If you would like to show PDFs, it is always higher to link to them, instead of embedding them within the page.

Historically these elements/parts have additionally been used for embedding content handled by browser plugins like Adobe Flash, however this technology is currently obsolete and isn't supported by new browsers.

If you would needing to embed plugin content, this can be the type of data you will need, at a minimum:

Let us see an example which embeds a PDF into a page see the below example:

PDFs were a necessary steppingstone within paper and digital, however they cause several accessibility challenges and may be tough to read on little screens. They do still tend to be popular in few circles, but it's far better to link to them in order that they may be downloaded or read on a separate page, instead of embedding them during a webpage.
